

## Problem K. Odd trip plans

- Time Limit: 3 sec

### Problem Statement

JAG is a country with  $n$  airports numbered through 1 to  $n$ . There are some airways, each of which connects two different airports bidirectionally. In other words, if an airway connects airports  $u$  and  $v$ , a passenger can move either from  $u$  to  $v$  or from  $v$  to  $u$  in a single flight. Airways may be newly established or abolished.

Mr. Oddytrip, who is a traveler loving odd numbers, plans a trip from an airport to another one by flights. Let's say that he boards  $k$  flights: A flight from airport  $p_1$  to  $p_2$ , then from  $p_2$  to  $p_3$ , then from  $p_3$  to  $p_4$ , and so on, and finally from  $p_k$  to  $p_{k+1}$ . This trip plan, which begins with  $p_1$  and ends with  $p_{k+1}$ , is written as

$p_1 \rightarrow p_2 \rightarrow p_3 \rightarrow p_4 \rightarrow \dots \rightarrow p_k \rightarrow p_{k+1}$ . According to his aesthetics, a trip plan is *beautiful* if each of  $n$  airports appear an odd number of times in the trip plan. For example, if  $n = 6$ , trip plans  $3 \rightarrow 4 \rightarrow 5 \rightarrow 6 \rightarrow 1 \rightarrow 2$  and  $1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 5 \rightarrow 3 \rightarrow 2 \rightarrow 3 \rightarrow 2 \rightarrow 6$  are beautiful while  $1 \rightarrow 3 \rightarrow 6$  and  $1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 1 \rightarrow 5 \rightarrow 6$  aren't. In particular, each of the  $n$  airports appears at least one in a beautiful trip plan.

Initially, there are  $m$  airways. Then, you are given  $q$  queries, which should be processed in the order they are given. Each query is of one of the two kinds below:

- 1  $x$   $y$ : The existence of the airway between airports  $x$  and  $y$  changes. If there is already an airway between airports  $x$  and  $y$ , then such an airway is abolished. In other words, Mr. Oddytrip is no longer able to board the direct flight between airports  $x$  and  $y$  (until it is newly established again). On the other hand, if there wasn't such an airway before, an airway between airports  $x$  and  $y$  is newly established. In other words, Mr. Oddytrip can board a direct flight between airports  $x$  and  $y$  (until it is abolished again).
- 2  $x$   $y$ : You have to determine whether there can be a beautiful trip plan which begins with airport  $x$  and ends with airport  $y$  using the airways which are available at that time.

### Input

The input consists of a single test case of the following format.

```

n m q
u1 v1
⋮
um vm
t1 x1 y1
⋮
tq xq yq

```

The first line consists of three integers  $n$ ,  $m$  and  $q$  ( $2 \leq n \leq 100,000$ ,  $0 \leq m \leq 100,000$ ,  $1 \leq q \leq 100,000$ ), where  $n$  is the number of airports in JAG country,  $m$  is the number of airways which are initially available, and  $q$  is the number of queries.

The  $i$ -th of the following  $m$  lines consists two integers  $u_i$  and  $v_i$  ( $1 \leq u_i < v_i \leq n$ ) representing that an airway between airports  $u_i$  and  $v_i$  is initially available. It is guaranteed that these  $m$  airways are distinct.

The  $j$ -th of the following  $q$  lines consists of three integers  $t_j$ ,  $x_j$  and  $y_j$  ( $1 \leq t_j \leq 2$ ,  $1 \leq x_j < y_j \leq n$ ) representing the type of the query and the numbers of two airports as described above. It is guaranteed that there is at least one query where  $t_j = 2$ .

### Output

For each query where  $t_j = 2$ , print "Yes" in a single line if there can be a beautiful trip plan which begins with airport  $x$  and ends with airport  $y$ . Otherwise, print "No" in a single line.

**Sample Input 1**

```
4 2 6
1 2
3 4
2 1 2
1 2 3
2 1 2
1 2 4
1 2 3
2 1 3
```

**Sample Output 1**

```
No
Yes
Yes
```

**Sample Input 2**

```
5 5 4
1 2
2 3
3 4
1 4
4 5
2 1 3
2 1 4
1 2 4
2 1 4
```

**Sample Output 2**

```
Yes
No
Yes
```
